

Security Advisory & Consulting

CATALOGUE OF SERVICES PROVIDED BY BITS N PAGES

Foreword

Welcome to the services catalogue for bits N pages. We offer tailored security advice for small businesses focusing on Security Awareness Programs, Information Security Standards Compliance, and Security Testing and Threat Management.

bits N pages strongly supports the right to tech literacy and digital privacy. We do not believe in simply stopping the mysterious “hacker”. Instead, we hope to build safer, more secure networks where trust, privacy and accessibility are paramount.

This catalogue lists our primary services. Apart from Information Security consulting, we also offer cybersecurity education and training for enthusiastic individuals.

Security Awareness Programs

We organise Security Awareness Programs for users at every level. We conduct in-depth interviews with the end-users to understand their needs, pain points and expectations. Our programs are aimed at the big corporation, the small business, the street vendor and the housemaker.

The Process

Inspired by Design Thinking, we use the Empathise, Define, Ideate, and Present pipeline to design our awareness programs. Empathise phase hopes to understand the users' needs. Define phase illustrates the scope and boundaries of the awareness program. Ideate phase designs solutions, and Present phase delivers the program to the end users.

what do the users need?
what are their pain points? **EMPATHISE**

define a problem statement **DEFINE**

build solutions, interact
with the end users **IDEATE**

present the solution.
does it solve the problem? **PRESENT**

InfoSec Standards Compliance

We offer guidance to achieve better compliance with international Information Security Standards such as ISO/IEC 27001, SOC 2 and GDPR. Compliance should not be about simply ticking boxes, thus, our advice helps businesses build an ISMS their customers trust.

The Process

Information Security Standards examine if a business' Information Security Management System implements appropriate control measures to ensure the Confidentiality, Availability and Integrity of data. We work closely with the business decision makers, employees and customers to design an effective and secure ISMS.

define the scope and reach of the ISMS

SCOPE

perform in-depth analysis of critical infrastructure

IDEATE

work with decision makers and employees to develop the ISMS

DESIGN

implement ISMS & prepare for compliance audit

IMPLEMENT

Security Testing & Threat Management

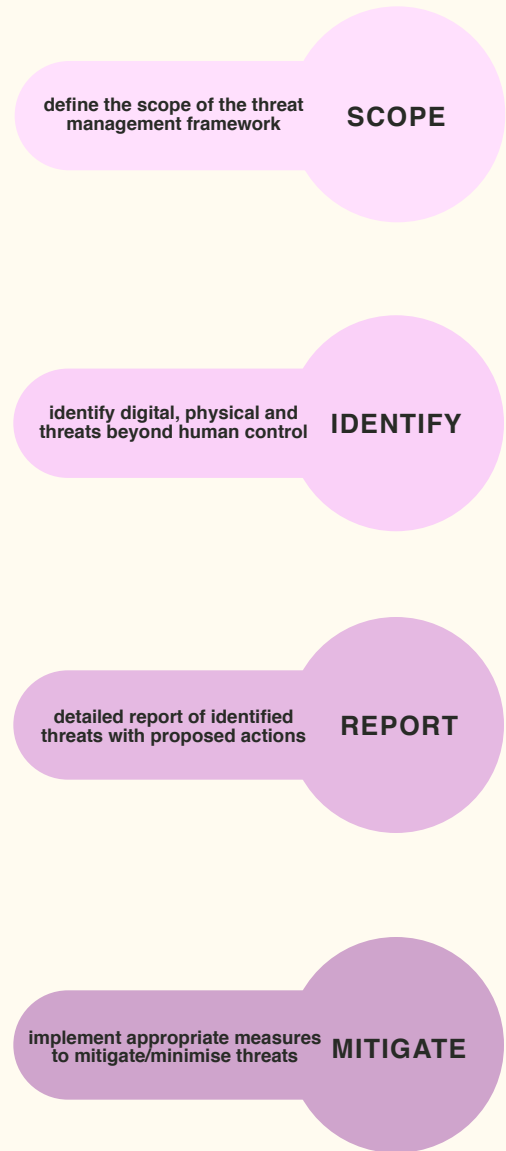

We probe the technical depths of a business's network by performing White Box and Black Box penetration testing. Our threat identification framework is flexible to the business needs and takes a holistic approach towards securing the business infrastructure.

The Process

Penetration testing is the act of working as an external "hacker" who identifies security flaws with the intention of mitigation instead of exploitation. We develop a business specific threat mitigation framework which takes Digital, Physical as well as threats beyond human control into account. Finally, we offer advice on threat mitigation and minimisation.

Information Security is the need of the hour. Whether the end user is an IT expert or a newcomer, information security holds equal importance for users at every level. At bits N pages, we wish to carry this idea forward.

When designing networks, systems or programs, cybersecurity should not be an afterthought. Instead, it should be incorporated at every step of the design process. We hope to be one more hand on the deck and help build a safer internet.
